

VIRGINIA HOWELL

Virginia joins Whooshh Innovations as Business Development & Regulatory Consult - Hydropower

Virginia has been involved in complex hydropower and environmental licensing issues for years, having worked on multi-year projects for Puget Sound Energy, Army Corps of Engineers, and Tetra Tech.

Virginia has also been an early proponent of Whooshh fish passage technologies. She shares our vision for a more affordable, less contentious, and quickly deployable solution, that shrinks timelines for threatened fish species and helps bring stakeholders together around a common resolve to deliver on clean renewable energy, while selectively restoring access for native fish species to their historical habitat.

"After watching the Whooshh technology emerge over time to provide timely, cost-effective and fish-friendly solutions needed on so many projects, I'm excited to be part of this next extraordinary phase of restoration and enhancement of our world-wide fishery resource." said Virginia Howell

Whooshh Innovations is headquartered in Seattle, Washington and our systems are now deployed all over the world. Our solutions are used to transport fish in processing plants where hygiene is critical and water is expensive, commercial aquacultures where fish welfare is paramount, and for fish passage past dams and obstacles (including where many fish are invasive and/or listed as threatened or endangered.)

“

“Virginia has been a trusted partner in FERC proceedings and so many diverse stakeholders, moving projects slowly forward even without a full complement of tools. We are thrilled “Ginny” has joined Whooshh to help us bring solutions today to these decades old headaches where litigation and mitigation have all too often lead to prolonged and unsatisfactory results”

said Vincent Bryan III, CEO of Whooshh
Innovations, Inc.
